

# Welding Inspection & Testing

Welding Procedure Specification (WPS)  
approved document describing welding procedures for a specific task

**Discontinuity**  
interruption or irregularity in the typical structure of a weld

**Defect**  
discontinuity or discontinuities that by nature, or by the accumulated effect, will render a part unusable or unable to meet code standards

**Tolerance**  
amount of leeway, either over or under, a particular size or angle can be off and still be within code, standards or specification requirements

**Dial Caliper**  
device with moveable arms, used to precisely measure objects

**Fatigue Testing**  
used to determine the fatigue strength of the material

**Shear Strength**  
material's ability to withstand forces that are trying to cut it at the cross section

**Code**  
body of laws arranged systematically for easy reference

American National Standards Institute (ANSI)  
writes welding codes

**Impact Strength**  
material's ability to withstand a suddenly applied load

**Filler Weld Break Test**  
used to determine the quality of the weld and is used as a welder qualification test

**Acid Etchant**  
acid used to remove a small layer of a base material

# Welding Inspection & Testing

Dwell Time

amount of time during which a given process occurs

Mill Scale

oxidized layer of metal found during steel manufacturing

Root Opening

separation at the joint root between pieces to be joined

Root Pass

base bead in a multiple-pass weld

Electrode Angle

angle of electrode in relation to the surface of the metal

Magnetic Arc Blow

the shifting of the arc in various directions in electric-arc welding due to the magnetic fields at the arc

Soundness

measurement of a substance to determine freeness from defects
